## **PROJECT DESCRIPTION**

To quantify the unit loading and current attenuation on samples of netting, this netting is to be used as containment for fish farms for deep water applications.

To develop a measuring apparatus that can be used either at IOT, (OEB, Tow Tank) or MUN, (Towing Tank, Flume Tank), and construct the apparatus. This will be done by measuring the hydrodynamic drag on samples of netting either by towing them or by subjecting the samples to a uniform current.

## **DESIGN CRITERIA**

The apparatus will have a measurement system to measure the load on the netting only. The attachment points for the netting are not to be measured. The attachment points are to be wrapped in a foil shape that will be independent of the net drag. The apparatus will be adapted to be able to adjust angles of attack in 5deg increments up to 45deg. The foil shapes will have to stay aligned with the direction of travel or flow. The scale of the netting is 1:1 or 1 m<sup>2</sup>, thus eliminating the potential errors in scaling but may cause errors due to edge effects of relatively small samples of full scale netting. The speed range is 0.1m/s to 3m/s, estimated loads on the net can be broken into three ranges Low 0-100N, Medium 100-500, High 500-2000N.

The 1m<sup>2</sup> of netting is to be submerged below the surface of the water by 0.5m. This gives an unsupported vertical leg length of 1.65m. Several designs

were investigated taking into account mostly the extreme moment that would be seen at the top of the vertical post. This moment was due to the initial tension in the net and the added load of the water going past the net. It was decided to go with a THK Linear Rail (SHS55+780L) and Block (SHS55 LCSSC1). These were chosen for the high end of the speed range; unfortunately the first test of the apparatus was at the slowest speed range, the current in the OEB. There was clearly too much seal friction in the SHS Blocks because of the Caged Ball Design.

A redesign was required, this time a Flat link design was conceived and analyzed using Algor. This design is only intended to measure loads in one direction.

## **DESIGN ANALYSIS AND RESULTS**

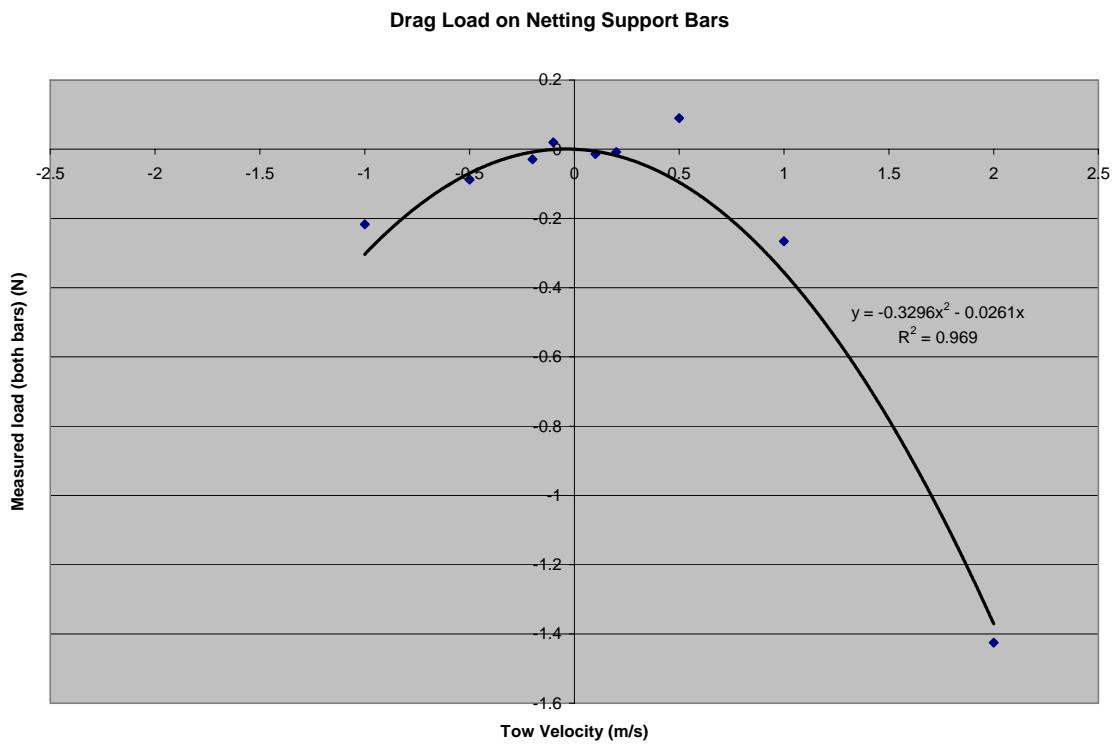

Following a rebuild on the instrumentation for measuring the drag on netting samples that replaced the pair of linear bearings with 8 flat spring steel pieces, which are 2" wide by .031" thick. These are sandwiched between two pieces of  $\frac{1}{4}$ " thick stainless steel just slightly shorter than the spring steel. There will still be a traditional style load cell flex link combination to measure the Drag force.

A Beam element model was created in Keycreator and imported into Algor for analysis. Results from the natural frequency and static stress are shown in Appendix A, Algor Results. The testing environment, with which this piece of apparatus could be subjected to, is quite variable. From slow steady state

current in the OEB and MUN Flume Tank, to high speed towing in either the Towing tank, Ice tank, Or Mun Tank. There will even be waves and current combined in the OEB, the waves would be in the range of 0.3 Hz to 1 Hz. The Algor Modal analysis confirms that mode 1 – mode 4 is in the range of 20-22Hz, which is far above what the wave maker can generate. The load plot is a measure of how little load this apparatus could measure, a 1lb load was placed on the simulated net at the very bottom of the vertical struts and load on the load cell measured, in this case each load cell measured 0.4996lbs, for a total of .99914 lbs. In the displacement plot a 100lb load is placed on the same simulated net to determine the max displacement of the flex link. This measurement is also what the top and bottom parts of the dynamometer would move in relation to each other.

### **Shielding**

The shielding for the load measuring elements provided by the fairings has been shown in tests to reduce the load on the Net Support Bars to less than 1.5 N on both bars combined (see figure below) for tow speeds up to 2 m/s.

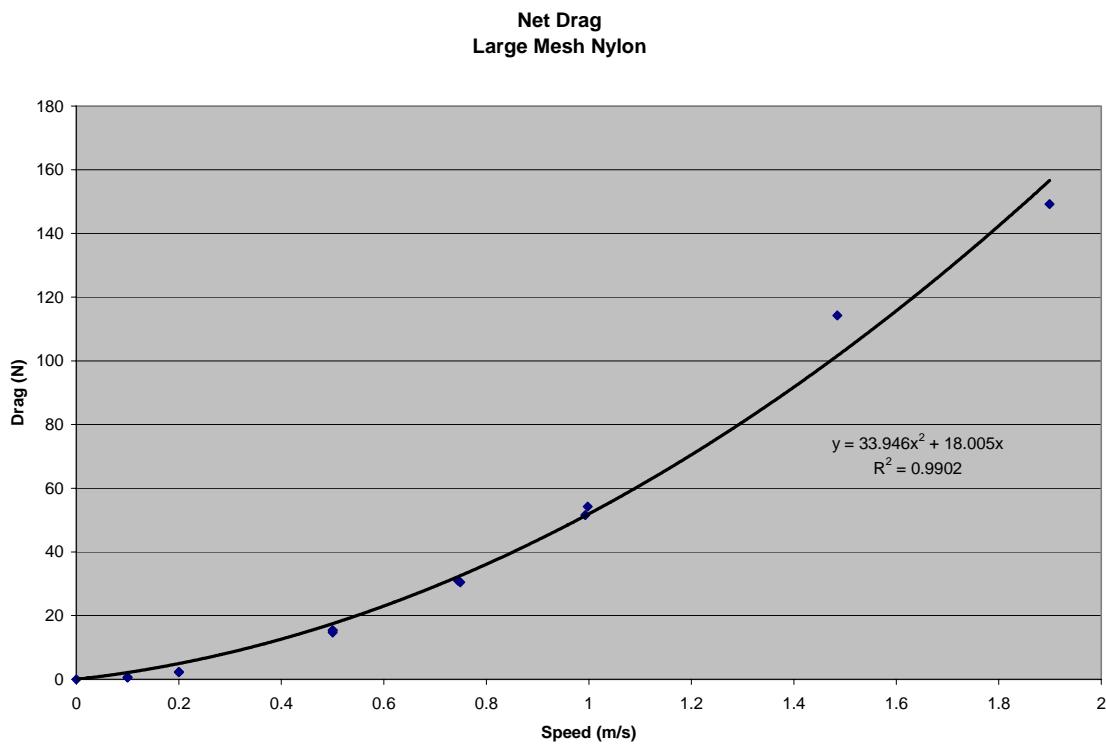

## Steady Drag Tests

In terms of steady drag tows the device has shown excellent repeatability and an ability to discriminate loads of 1 N or less. The attached plots and statistics show results from low speed drag tests in both directions on a sample of large mesh nylon netting. The average values are less than 1 N and the device returns to its resting load within 0.5 N.

In addition the complete series of drag tests covering a range of speeds on this sample of netting are shown to be consistent without regard for tow direction.

With reference to the chart below, the points below 1 m/s tow speed are all double values, one forward and one reverse. The negligible difference in values indicates that the device consistently returns to zero, does not exhibit any hysteresis or stickiness and is consistent in measurement.

## Unsteady Drag Tests

Additional tests on the same netting sample were conducted in waves. Raw data is attached as a plot without statistics and no further analysis has yet been conducted. The data exhibits a bump in each load cycle. This may be associated with the instrumentation passing through zero load, or it may be associated with

the net transition from positive deformation to negative deformation associated with changes in flow direction. At present we believe that the more likely cause is vibration in the supporting structure, which was picked up by the instrumentation.

## **SUMMARY**

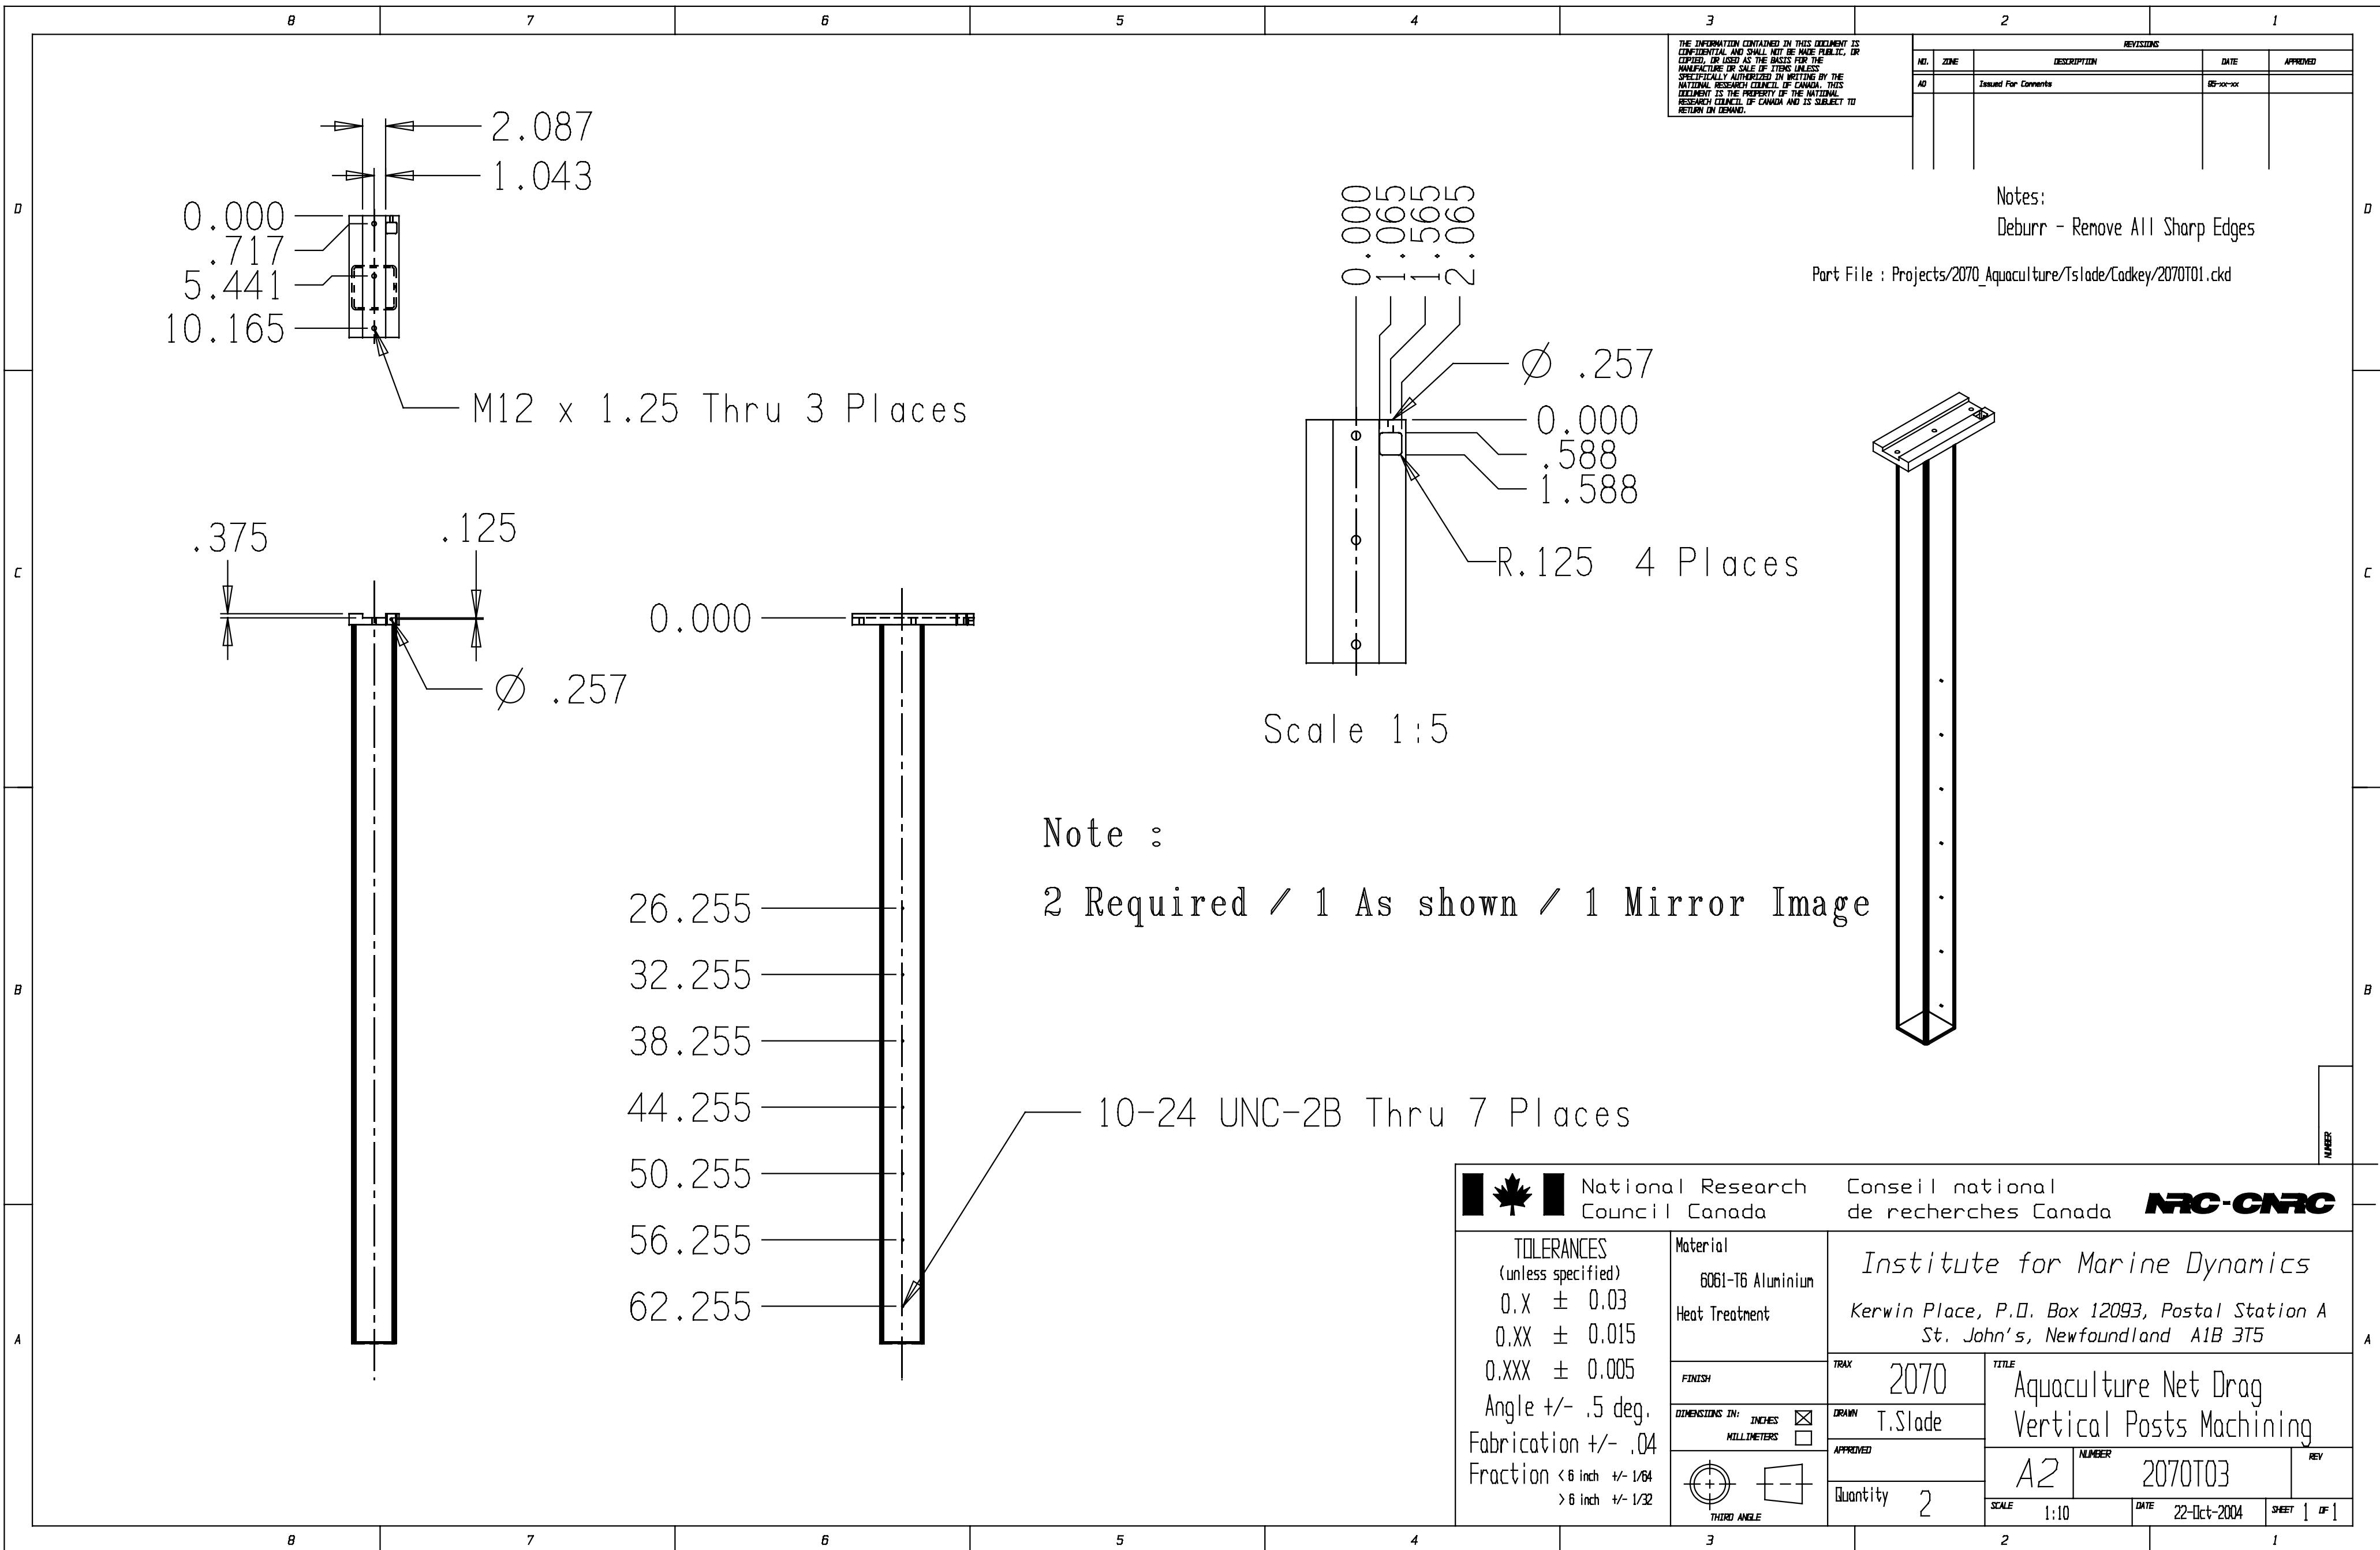

The device is performing well and certainly at, if not above, expectations. The sensitivity, repeatability and lack of hysteresis will provide the ability to measure loads under the full range of netting and flow conditions contemplated for the net drag and added mass study.

## **DRAWINGS**

Spring Steel to Decouple Forces

From: Sheldon Mercer [sheldonm@engr.mun.ca]  
Sent: May 3, 2005 2:23 PM  
To: trent.slade@nrc.ca  
Subject: hardness test

Trent,

Sorry this took so long. I done six hardness test. Three Rockwell C and three Rockwell A. The results are as follows:

Rockwell C: 40,40,40  
Rockwell A: 69,70,69

The chart that I have indicates both in the same region.

The Rockwell C test left a small extrusion spot on the opposite side of the test piece after the test was completed. When you come by to pick up the piece I'll show you.

**NOTICE TO CUSTOMERS:** All Purchase Orders must indicate a method of shipment, including Courier Name and Account number. Exclusion of Courier information will prompt goods to be shipped prepaid and charged. Please note that hazardous goods can ONLY be shipped via Purolator ground. Intertechnology does not declare value for transit insurance unless specified in writing by Customer.

Our terms, unless otherwise shown, are net 30 days. Any unpaid balance, 30 days after shipment will be subject to charges calculated at a rate of 8% per annum above the then effective prime rate until paid in full.

**US Customers** - Supply Federal Tax ID Number  
**Overseas Customers** - Supply VAT Registration Number  
**Ontario Customers** - Supply PST Exemption Information

*Our people make the difference.*

# MODEL 60001

## S-BEAM LOAD CELL

### APPLICATIONS

- Tank, bin and hopper weighing
- Level and inventory monitoring
- Truck scale conversions
- Tension and compression measurements

### FEATURES

- Rated capacities of 25 to 20,000 pounds
- 50 kilograms to 5 metric tons
- Stainless steel version is model 60050
- Integral loading bracket
- Designed for single or multiple load cell applications
- Constructed of high quality alloy tool steel
- Nickel plated for outstanding corrosion resistance
- Trade certified for NTEP Class III:5,000 Divisions and Class III:10,000 Divisions available
- **Sensorgage™** sealed to IP67 standards
- **Cell Guard™** Two Year Warranty
- Factory Mutual System Approved for Classes I, II, III; Divisions 1 and 2; Groups A through G.
- Also, **Non-Incendive** ratings (No Barriers!).
- ISO 9001 Certified manufacturing facilities

**ISO  
9001**

**Factory  
Mutual  
System**  
Approved

60063
